The General Education Requirement in the Biological Sciences

All students are required to complete at least two quarters of Biological Sciences course work to satisfy the General Education requirement in the Biological Sciences. The goal is to provide students of all majors and academic interests with a broad foundational understanding of biology and an opportunity to focus on a specific area of interest within the discipline. The requirement should be completed by the end of the second year.

Most students choose one of the following options to meet the General Education requirement in the Biological Sciences. For other options, see Specific General Education Requirement for Certain Majors.

1. A two-quarter General Education Sequence for non–Biological Sciences majors. Students choose one of two options:
   - BIOS 10130 Principles of Biology or BIOS 10140 Inquiry-based Exploration of Biology followed by any Topics course (course numbers BIOS 11125-BIOS 16120 and BIOS 27721-27723)
   - A two-quarter sequence (BIOS 10500 Metabolism and Exercise - BIOS 10501 Metabolism and Nutrition or BIOS 10602 Multiscale Modeling of Biological Systems I - BIOS 10603 Multiscale Modeling of Biological Systems II).

   Note: Students cannot receive credit for both BIOS 10130 Principles of Biology and BIOS 10140 Inquiry-based Exploration of Biology.

2. The first two courses of the Pre-Med Sequence (BIOS 20170 Microbial and Human Cell Biology through BIOS 20175 Biochemistry and Metabolism) for students interested in completing the requirements for medical school but not majoring in Biological Sciences. Note: BIOS 20171 requires concurrent enrollment with BIOS 20172.

3. The first two courses in a Fundamentals Sequence for Biological Sciences majors: BIOS 20153 Fundamentals of Ecology and Evolutionary Biology and BIOS 20151 Introduction to Quantitative Modeling in Biology (Basic) or BIOS 20152 Introduction to Quantitative Modeling in Biology (Advanced). Note: Nonmajors may not use BIOS 20151 or BIOS 20152 as a topics course.

4. Completion of three quarters of the Advanced Biology Fundamentals Sequence. Students with a score of 4 or 5 on the AP Biology test who complete the first three quarters of an Advanced Biology Fundamentals Sequence will be awarded a total of two quarters of credit to be counted toward the general education requirement in the biological sciences and three quarters of credit for Biological Sciences Fundamentals courses. For more information about the Advanced Biology Fundamentals Sequence, see the Biological Sciences (http://collegecatalog.uchicago.edu/thecollege/biologicalsciences/) Program of Study page in this catalog.

Advanced Placement Credit

For students who do not plan to prepare for the health professions or pursue a major that requires specific courses for the general education requirement, a score of 4 or 5 on the AP Biology test confers credit for BIOS 10130 Principles of Biology or BIOS 10140 Inquiry-based Exploration of Biology. These students complete the general education requirement in the Biological Sciences with either one or two Topics courses, depending on how the requirements in the mathematical and physical sciences are met; students should contact their College adviser for details.

General Education Sequences for Non–Biological Sciences Majors

Foundational Courses for Non-Majors

BIOS 10130. Principles of Biology. 100 Units.

What is life? How does it work and evolve? This course uses student-centered interactive learning in the lab, assigned readings from both the popular press and primary scientific literature, and directed writing exercises to explore the nature and functions of living organisms, their interactions with each other, and their environment.

Instructor(s): Staff
Terms Offered: Autumn Spring Summer Winter

Multiple sections of BIOS 10130 Principles of Biology are taught throughout the year. Sections are taught from a different perspective based upon the specialty of the instructor. Students should register for the section that best suits their interests based upon the descriptions below:

A. Microbes and Immunity. This section covers the most basic concepts in biology, such as life, macromolecules, cells, energy, metabolism, evolution, and genomics, as well as human anatomy and physiology, drawing examples from microbiology and immunology to tie these basic concepts together. The impact of our interactions with microorganisms in our evolution is highlighted in many ways. Hands-on laboratories, readings, and discussion sessions complement lectures. B. Fineschi. Autumn, Winter, Spring, L.

B. Evolution. What is life? How does it work and evolve? This course uses student-centered interactive learning in the lab, assigned readings from both the popular press and primary scientific literature, and directed
writing exercises to explore the nature and functions of living organisms, their evolution, and their interactions with each other. A. Hunter. Autumn, Spring. L.

C. Cancer Biology. This course covers most basic concepts of biology such as the characteristics of life, structure, function and division of the cell, macromolecules, metabolism, genetics and principles of evolution. It will also explore how DNA is replicated and transcribed and how proteins are made. As genes control many biological processes, gene regulation will be discussed. An integral part of this course will be the discussion of how anomalies of most of the introduced concepts may lead to cancer. Selected lectures will be delivered in a flipped format, and team-based and other active learning pedagogies will be adopted in this course. Lab activities will be integrated in the course materials. Reading of assigned scientific topics, writing exercises, team-innovative projects and presentations will be used for assessment. A. Fauzy. Autumn, Winter. L.

D. Ecology and Evolution. This course focuses on the interaction of organisms with their environment and evolutionary processes that lead to diversity and adaptation. We will examine biological processes at the cellular and organismal levels across a wide range of organisms, considering their ecological similarities and differences in an evolutionary framework. Population and ecosystem levels will be examined to promote understanding of the importance of diversity in ecosystem health and the impacts of an ever increasing human population. E. Larsen. Winter. L.

BIOS 10140. Inquiry-based Exploration of Biology. 100 Units.

In this course students will be able to conduct their own research projects to experience how biologists frame questions and test hypotheses. This inquiry-based approach permits students to learn fundamental biological principles while participating in scientific endeavors and expanding our knowledge of living systems. Classes will take place in the lab, integrating lectures, discussions, and experiments in active sessions, thus eliminating the separation between theory and practice. Students will also have an opportunity to develop communication skills during the quarter, presenting their proposals and results to their peers and instructors, in seminar or symposium formats. Each course instructor will focus their section on a different major problem in the biological sciences that will frame the students research questions.

Instructor(s): Staff Terms Offered: Autumn Spring Winter
Note(s): Equivalent to BIOS 10130.

Multiple sections of BIOS 10140 Inquiry-based Exploration of Biology are taught throughout the year. Sections are taught from a different perspective based upon the specialty of the instructor. Students should register for the section that best suits their interests based upon the descriptions below:

A. Neurobiology. Deciphering the relationship between an organism’s genetic makeup (genotype) and its characteristics (phenotype) and uncovering how the brain works are two Grand Challenges in Biology. Embedded within these Grand Challenges are questions central to understanding the biological basis of organismal behavior in a changing environment, the answers to which have significant societal implications in the context of human health, climate change, and many other areas. This course aims to explore these Grand Challenges by examining the genetic, neurobiological, and environmental mechanisms shaping complex behaviors. Through the development of an inquiry-based research project, complemented by short lectures and discussions of the scientific literature, students will be introduced to fundamental biological principles, the logic of scientific reasoning and experimental design, and methods for collecting, evaluating, and communicating scientific evidence. M. McNulty. Autumn, Spring. L.

B. Microbiotechnology: Exploring Biodiversity and dynamic ecosystem of the human microbiome. Human beings are an ecosystem, with multiple types of microbes living in various niches within the human body. How these “multitudes” in our body become established, interact with each other and react to the chemicals in our foods (nutrients and specific chemicals, antibiotics and more) is a big question. Through the exploration of probiotic microbes and potential food borne pathogens, and their relative susceptibility to antibiotics and other plant extracts that are commonly used to spice-up foods, students will be introduced to various fundamental biological principles. We will study life processes ranging from molecular to cellular to organismal levels and then extend to populations and ecosystems. Working in groups, students will identify a microbiome and antimicrobial specific question, propose a testable hypothesis and develop an inquiry-based research project. They will also learn to navigate the professional scientific literature and critically evaluate published scientific information. Supplemented by short lectures and discussions of the scientific literature, they will get familiar with the logic of scientific reasoning and methods for collecting, analyzing and communicating scientific data. N. Bhasin. Spring. L.

C. Ecology. Biodiversity encompasses all different biological organisms in our planet, from viruses, microorganisms, plants, fungi, invertebrates, and vertebrates. Interactions among these organisms form a complex and dynamic network crucial for our planet. How does urbanization, a process transforming ecosystems all across our planet, affect biodiversity? This fundamental question has been poorly studied, specifically estimations of species diversity in city habitats and characterization of urban biological communities, both central to our understanding of how urbanization impacts crucial ecological functions, such as pollution, water filtration, and waste decomposition. In this course, you will develop your own research project exploring components of the biodiversity in your neighborhood, e.g. invertebrate or plant communities, and their interactions. You will identify local habitats where you will collect data and specimens to document species diversity and address research questions regarding their communities, for example: do natural areas have
more or less diversity than developed areas? Or, is the number of exotic species higher, equal or smaller than
native species in parks around my neighborhood? Through the project you will review fundamental biological
concepts, from the DNA and genetic information of the organisms you will collect, observations of their cells
and their tissues, learn about their reproductive mechanisms, search for information about their evolution, and
explore their populations, trophic networks, and community structures. Finally, this course will provide you with
an opportunity to experience the process of scientific research, allowing you to ask your own scientific questions,
test hypotheses, identify legitimate sources of information, and analyze data. O. Pinuela. Autumn, Winter. L.

D. Cell and Developmental Biology. This course approaches biology through the lens of cell and developmental
biology. How do organisms grow from single cells into complex organisms with multiple tissue types?
Laboratory exercises will be inquiry-based and addressing the question of how tissues regenerate and repair
themselves after damage. A. Brock. Winter. L.

TOPICS COURSES FOR NON-MAJORS
The courses that follow have a prerequisite of BIOS 10130 Principles of Biology, or BIOS 10140 Inquiry-
based Exploration of Biology, or a score of 4 or 5 on the AP Biology test. Attendance is required at the first class
to confirm enrollment. Students who choose to complete only one general education course in the mathematical
sciences may take a second Topics course as part of the general education requirements.

BIOS 11125. Life Through a Genomic Lens. 100 Units.
The implications of the double helical structure of DNA triggered a revolution in cell biology. More recently, the
technology to sequence vast stretches of DNA has offered new vistas in fields ranging from human origins to the
study of biodiversity. This course considers a set of these issues, including the impact of a DNA perspective on
the legal system, on medicine, and on conservation biology.
Instructor(s): A. Turckewitz, M. Nobrega Terms Offered: Winter
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-
MED STUDENTS, except by petition.
Equivalent Course(s): ENST 12402

BIOS 11140. Biotechnology for the 21st Century. 100 Units.
This course is designed to provide a stimulating introduction to the world of biotechnology. Starting with an
overview of the basic concepts of molecular biology and genetics that serve as a foundation for biotechnology,
the course will segue into the various applied fields of biotechnology. Lectures and the corresponding activities
will include microbial biotechnology, agricultural biotechnology, biofuels, cloning, bioremediation, medical
biotechnology, DNA fingerprinting and forensics. These activities have been modified to adapt to online teaching
and learning this summer, in light of the COVID-19 pandemic. The typical hands on experiments in wet labs
will be replaced with virtual tutorials on techniques, critical data analysis, reading and discussing scientific
literature and possibly presenting important findings in a “virtual poster session”. The goal of this course is to
provide students with an appreciation of important biotechnology breakthroughs, the techniques involved and
the associated bioethics issues.
Instructor(s): N. Bhasin Terms Offered: Winter
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-
MED STUDENTS, except by petition.

BIOS 12114. Nutritional Science. 100 Units.
This course examines the underlying biological mechanisms of nutrient utilization in humans and the scientific
basis for setting human nutritional requirements. The relationships between food choices and human health
are also explored. Students consider how to assess the validity of scientific research that provides the basis for
advice about how to eat healthfully. Class assignments are designed to help students apply their knowledge by
critiquing their nutritional lifestyle, nutritional health claims, and/or current nutrition policy issues.
Instructor(s): P. Strielean Terms Offered: Autumn Spring Summer
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-
MED STUDENTS, except by petition.
Note(s): Credit may not be earned for both BIOS 12114 and BIOS 10501

BIOS 12115. Responses of Cardiopulmonary System to Stress. 100 Units.
This course is designed to provide students an overview of basic concepts involved in the functioning of
cardiopulmonary vascular systems. Special emphasis will be given to different regulatory mechanisms working
at the cell, tissue and organ levels to control the systems functioning during stress conditions. We also discuss
recent topics related to molecular basis of adaptation and drugs designed to treat mal-adaptive changes taking
place in the heart and lungs (vessels) subjected to various-types of pathological stresses. Instructors, who are
both actively engaged in research to understand molecular basis of cardiopulmonary vascular diseases, take this
course beyond the knowledge of standard textbook content.
Instructor(s): M. Gupta, Y. Fang Terms Offered: Spring
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-
MED STUDENTS, except by petition.

BIOS 12116. The Human Body in Health and Disease. 100 Units.
This course is designed to provide an overview of physiological organ systems under different states of health
and disease. A comprehensive tour through the human body will take students through the anatomy and
functioning of several systems including, but not limited to, the cardiovascular, respiratory, nervous, renal, gastrointestinal, and immune systems. We will examine each of these systems under normal conditions and from the perspective of disease. A variety of pathological conditions including diabetes, heart and kidney diseases, neurodegenerative conditions, and autoimmune diseases, will be covered with an emphasis on how many diseases involve multiple organ systems.

Instructor(s): M. McNulty Terms Offered: Autumn
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 12117. The 3.5 Billion Year History of the Human Body. 100 Units.
This course looks at the structure, function, and deep history of the human body. Each major organ and system of the body is explored from perspectives of anatomy, paleontology, and developmental genetics to reveal the deep history of the body and our connections to the rest of life on the planet.

Instructor(s): N. Shubin Terms Offered: Autumn
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.
Note(s): Due to significant overlap of course content, students may register for only one of PHSC 11000, BIOS 12117, or GEOS 13900/BIOS 13123

BIOS 12121. Physiology in Extreme Environments. 100 Units.
Humans live nearly everywhere, including arid deserts, the tops of mountains, and frigid arctic tundra. We have also expanded our reach to include the bottom of the ocean and the International Space Station. Our bodies’ ability to make physiologic adaptations allows us to survive in each of these environments. Physiology in Extreme Environments will enhance your understanding of how your body reacts to stressors such as high altitude, diving, spaceflight, isolation, and more. Discussion topics will include a review of the cardiovascular and respiratory systems, exercise physiology, and cerebral blood flow. We will also discuss the physiology of sleep and fatigue. This knowledge will then be used to explain how life support environments work and how we survive in dangerous environments.

Instructor(s): K. Ruskin, A. Garcia, A. Clebone Terms Offered: Winter
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 12122. Gourmet Biology: Exploring Relationships between Human Nutrition, Food & Biodiversity. 100 Units.
Human omnivorous nature has allowed us to fulfill our caloric requirements eating a large diversity of organisms. The neurological perception of food - taste, smell, texture, and appearance - highly influences our nutrition. It also contributes to our instinct for experimenting constantly with new combinations of ingredients and ways of cooking. Everywhere humans have travelled and settled, we have established close relationships with the local biodiversity to identify food sources. We have domesticated and transported several of those species throughout the world, dramatically changing ecosystems at a global scale. In this course, students will learn basic principles of human nutrition and neurophysiology to explore how our biology has influenced the selection of species we use as food sources and how, through that selection, we continuously impact ecosystems around the world.

Instructor(s): O. Pineda-Catalan Terms Offered: Summer
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 12123. The Scientific Story of Selected Nobel Prizes in Physiology and Medicine. 100 Units.
This course will use information from the activities of winners of the Nobel prize in Physiology and Medicine or Chemistry as case studies describing the nature of outstanding scientific investigation. Students will in pairs present to the class the outcome of the following questions as applied to each chosen Nobel exemplar. Over the duration of the class, depending on the size of the class each student may be assigned one or two separate Nobelists. In cases where there are two unrelated winners, each student of a particular pair will focus on the work of one of the winners, e.g., in the case of Bloch and Lynen, one student will focus on Bloch and one on Lynen. Where this is not the case, e.g., Brown and Goldstein, one student will focus on the work leading up to the prize and the other will focus on the implications in future use of the findings.

Instructor(s): G. Getz Terms Offered: Autumn
Prerequisite(s): BIOS 10130 or BIOS 10140 and a college-level chemistry course. NO BIOLOGICAL SCIENCES MAJORS OR NON-MAJOR PRE-MED STUDENTS, except by petition.

BIOS 13111. Natural History of North American Deserts. 100 Units.
This lecture course focuses on the ecological communities of the Southwest, primarily on the four subdivisions of the North American Desert, the Chihuahuan, Sonoran, Mohave, and Great Basin Deserts. Lecture topics include climate change and the impact on the flora and fauna of the region; adaptations to arid landscapes; evolutionary, ecological, and conservation issues in the arid Southwest, especially relating to isolated mountain ranges; human impacts on the biota, land, and water; and how geological and climatic forces shape deserts.

Instructor(s): E. Larsen Terms Offered: Spring
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.
BIOS 13112. Natural History of North American Deserts; Field School. 100 Units.
This lecture/lab course is the same course as BIOS 13111, but includes a lab section preparatory to a two-week field trip at end of Spring Quarter, specific dates to be announced. Our goal in the lab is to prepare proposals for research projects to conduct in the field portion of this course. Field conditions are rugged. Travel is by twelve-passenger van. Lodging during most of this course is tent camping on developed campsites.
Instructor(s): E. Larsen Terms Offered: Spring
Prerequisite(s): Consent of instructor. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 13123. Biological Evolution. 100 Units.
This course is an introduction to evolutionary processes and patterns in present-day organisms and in the fossil record and how they are shaped by biological and physical forces. Topics emphasize evolutionary principles. They include DNA and the genetic code, the genetics of populations, the origins of species, and evolution above the species level. We also discuss major events in the history of life, such as the origin of complex cells, invasion of land, and mass extinction. This course is part of the College Course Cluster program: Climate Change, Culture and Society. (L)
Instructor(s): D. Jablonski Terms Offered: Winter
Prerequisite(s): BIOS 10130 or BIOS 10140; No Biological Sciences majors except by petition to the BSCD Senior Advisers.

BIOS 13128. Plant-Animal Interactions. 100 Units.
In this course we investigate the ecological interactions between plants and animals, and their evolution. Through readings and discussion we explore herbivory and mutualisms (pollination, seed dispersal). How do plants defend themselves against herbivores? How have plants and their seed dispersers, pollinators, and predators co-evolved?
Instructor(s): A. Hunter Terms Offered: Autumn Winter
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 13133. Resolving the Environmental Crisis. 100 Units.
Humans have evolved unique capabilities for transforming their environment rather than accommodating to it. But we pass the costs of improving our circumstances onto the environment and therefore onto our own future generations. This pattern has accelerated enormously during the past 200 years of industrialization. It is now profoundly important for us to come to terms with the impact of the human enterprise on all aspects of our environment as well as our health, welfare, security and pleasure in life. The environmental crisis is the defining issue for the 21st Century, yet traditional values are often poor guides for making our activities sustainable. How can we improve our economic, social and civil institutions so as to resolve our environmental crisis? How should societies now joining the industrial world proceed with their own development? This course will consider these and related issues and approaches to their resolution.
Instructor(s): T. Steck Terms Offered: Autumn
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS AND NO NON-BIOLOGY PRE-MEDS, except by petition.

BIOS 13140. The Public and Private Lives of Insects. 100 Units.
This course examines the ecology and evolution of insects, from their early evolution over 350 million years ago to their adaptations that allow them to exploit nearly every habitat on earth and become the most diverse animal group on the planet. We explore the basic biology of insects that have allowed them to become the largest group of animals on the planet, making up approximately 1.5 million of the 2 million described species.
Instructor(s): E. Larsen Terms Offered: Autumn Spring. Spring quarter, only in even years
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 13142. From Fossils to Fermi’s Paradox: Origin and Evolution of Intelligent Life. 100 Units.
The course approaches Fermi’s question, "Are we alone in the universe?," in the light of recent evidence primarily from three fields: the history and evolution of life on Earth (paleontology), the meaning and evolution of complex signaling and intelligence (cognitive science), and the distribution, composition and conditions on planets and exoplanets (astronomy). We also review the history and parameters governing extrasolar detection and signaling. The aim of the course is to assess the interplay between convergence and contingency in evolution, the selective advantage of intelligence, and the existence and nature of life elsewhere in the universe - in order to better understand the meaning of human existence.
Instructor(s): P. Sereno; L. Rogers; S. London Terms Offered: Not offered in 2021-2022
Prerequisite(s): Third or fourth-year standing. This course does not meet the requirements of the Biological Sciences major.
Equivalent Course(s): PSYC 28810, BPRO 28800, ASTR 18700
BIOS 13253. Apes and Human Evolution. 100 Units.
This course is a critical examination of the ways in which data on the behavior, morphology, and genetics of apes have been used to elucidate human evolution. We emphasize bipedalism, hunting, meat eating, tool behavior, food sharing, cognitive ability, language, self-awareness, and sociability. Visits to local zoos and museums, film screenings, and demonstrations with casts of fossils and skeletons required.
Instructor(s): R. Tuttle Terms Offered: Spring. Spring 2022
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.
Equivalent Course(s): EVOL 38600, HIPS 21428, ANTH 21428, ANTH 38600

BIOS 14112. Workings of the Human Brain: From Brain to Behavior. 100 Units.
This course examines how the brain generates behavior. Topics include the organization of the nervous system; the mechanisms by which the brain translates external stimuli into electrical and chemical signals to initiate or modify behavior; and the neurological bases of learning, memory, sleep, cognition, drug addiction, and neurological disorders.
Instructor(s): M. McNulty, M. Tan Terms Offered: Spring Summer
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS, NEUROSCIENCE, OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 14114. Drugs Galore: What They Are and What They Do to You. 100 Units.
The course will cover several drugs used and abused (such as alcohol, ritalin, adderall, cannabinoids), their targets and pharmacological actions.
Instructor(s): R. Zaragoza Terms Offered: Autumn Winter
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 14116. Introduction to Social Neuroscience. 100 Units.
This course on social neuroscience addresses a timely topic in the fields of medicine, psychology, and the neurosciences. Specifically, a key challenge in the study of the brain and its effects on health and behavior resides not only in determining how one’s mental processes map onto their own patterns of brain activity but also how this activity is modulated by shared representations with other individuals through various neural, hormonal, cellular, and genetic mechanisms. These are questions that fall within the field of social neuroscience - the study of the neural, hormonal, cellular, and genetic mechanisms underlying the super-organismal structures. When social neuroscience was first proposed a quarter century ago, attention was given to why the notion of “social neuroscience” was not an oxymoron and to articulate a set of principles (multilevel analysis) that justified attention to super-organismal structures (e.g., a pair bond, marriage, salutary relationship) in the analysis of the function of the nervous system and brain. This was prior to the recognition of the importance of epigenetics and the sophisticated means of probing the neural aspects of shared representations, embodied cognition, that exist today. Indeed, genes were still thought to be strong if not invariant determinants of human illness, phenotypes and behavior. So where does social neuroscience now fit within medicine and the science of brain, mind, and behavior? That is the focus of the course.
Instructor(s): S. CACIOPPO Terms Offered: Autumn
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 15115. Cancer Biology: How Good Cells Go Bad. 100 Units.
This lecture/discussion course examines the multi-step process by which normal cells become malignant cancer cells. Topics include how defects in the regulation of proliferation, differentiation, and apoptosis can occur in cancer cells, as well as how cancer cells can acquire the ability to attract blood vessels (angiogenesis) and to invade other organ systems (metastasis). We emphasize the study of signal transduction pathways and how they are altered in cancer cells. The concept of genes that cause cancer (oncogenes) and genes that deter cancer (tumor suppressor genes) is discussed. New disease treatments that target specific molecular defects within cancer cells are reviewed.
Instructor(s): M. Villereal Terms Offered: Spring Winter
Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 16120. The Biological Nature of Psychological Problems. 100 Units.
This course is based on the strong assumption that psychology is a biological science, albeit with elements of the social sciences. The course uses a combination of lectures and classroom discussion of primary and secondary source readings assigned for each class meeting. It presents a strong biological science perspective on individual differences in emotions, motivations, and cognitions that cause distress or interfere with adaptive life functioning, but does so in a non-stigmatizing manner. The course begins with a description and discussion of the nature of psychological problems. The course will survey what is currently known about the neural, environmental, and epigenetic bases of such problems and the methods used to study genetic influences and gene-environment interactions. Next, students will review what is currently known about the neural and other biological mechanisms involved in maladaptive individual difference in emotion, motivation, and cognitive processes, with discussion of the methods of studying such mechanisms in humans and nonhumans. The pros
and cons of the medical model of 'mental illness' will be discussed as the major contrast with the natural science view advocated by the instructor.

Instructor(s): B. Lahey

Prerequisite(s): BIOS 10130 or BIOS 10140. NO BIOLOGICAL SCIENCES MAJORS OR NON-MAJOR PRE-MED STUDENTS, except by petition.

Equivalent Course(s): PSYC 28850

TWO-QUARTER BIOLOGY SEQUENCES FOR NON-MAJORS

These sequences are an alternative to taking BIOS 10130 Principles of Biology or BIOS 10140 Inquiry-based Exploration of Biology plus a Topics course to fulfill the general education requirement in the Biological Sciences. Students MUST take BOTH courses in a sequence.

METABOLISM SEQUENCE

BIOS 10500. Metabolism and Exercise. 100 Units.

Must be taken in sequence with BIOS 10501. This course examines the flow of energy through the human body-from what we eat to what we can do. Basic physiology, metabolism, and exercise concepts are covered from cells to systems. Students should be prepared to alter their diet and/or physical activity. This course is intended to be followed by BIOS 10501 (Metabolism and Nutrition). Prerequisite(s): This course MUST be followed by the second course in the sequence. NO BIOLOGICAL SCIENCES MAJORS, except by petition.

Instructor(s): J. Kennedy

Prerequisite(s): This course MUST be followed by the second course in the sequence. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

BIOS 10501. Metabolism and Nutrition. 100 Units.

Must be taken in sequence with BIOS 10500. Taking a scientific approach to nutrition, this course covers nutritional requirements and why they are required for human health by exploring their function at the cellular and molecular level. Basic physiology concepts related to nutritional health are covered, including digestive physiology and some aspects of endocrinology. As a continuation of the exercise concepts covered in BIOS 10501, the relationship between exercise and nutrition is considered. Students complete a dietary analysis of their food intake to critique their individual nutritional health.

Instructor(s): P. Strieleman

Prerequisite(s): BIOS 10500. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

Note(s): Credit may not be earned for both BIOS 10501 and BIOS 12114.

COMPUTER MODELING SEQUENCE

BIOS 10602. Multiscale Modeling of Biological Systems I. 100 Units.

Modern biology generates massive amounts of data; this course is devoted to biological information and the models and computational techniques used to make sense of it. The first course in the sequence begins with the organization of life at the molecular level, and builds a physical understanding to the structure of macromolecules such as DNA, RNA and proteins. Students learn about biological databases, algorithms for sequence alignment and phylogenetic tree building. Students will also be introduced to basics of high performance computation and its application to the field of bioinformatics. They will learn how to use our in-house supercomputer to process and analyze next generation gene sequencing data in order to identify disease-relevant variants. Students implement computational algorithms using R and Unix.

Instructor(s): E. Haddadian

Prerequisite(s): MATH 13300/15300/16300 or equivalent placement. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition. This course MUST be followed by the second course in the sequence.

BIOS 10603. Multiscale Modeling of Biological Systems II. 100 Units.

Must be taken in sequence with BIOS 10602. Major Advances in understanding how life works at the molecular level have revolutionized biology. The second course in the sequence is dedicated to the study of how large molecules, such as proteins, DNA, carbohydrates, and phospholipids, perform their functions. The course will begin with a solid grounding in molecular chemistry and the forces that govern interactions between atoms and molecules. This is followed by an overview of structure and function of macromolecules, in particular of proteins and enzymes. The students will learn how to visualize macromolecules and measure their basic properties and to model their physical movements by means of molecular dynamic simulations running at university’s super computer facility. The course will then proceed to describe how interactions of these molecules produce functioning organelles and cells, and how molecular mishaps can lead to disease.

Instructor(s): E. Haddadian

Prerequisite(s): BIOS 10602 or consent of instructor. NO BIOLOGICAL SCIENCES MAJORS OR NON-BIOLOGY PRE-MED STUDENTS, except by petition.

PRE-MED SEQUENCE FOR NON-MAJORS

BIOS 20170 through BIOS 20175

This integrated sequence explores the molecular, cellular, organismal, and biochemical properties of living systems. It is designed to prepare students who do not intend to major in Biological Sciences for graduate study in the health professions. This five-course sequence begins with BIOS 20170 Microbial and Human Cell
Biology in the Winter Quarter and both BIOS 20171 Human Genetics and Developmental Biology and BIOS 20172 Mathematical Modeling for Pre-Med Students I in the Spring Quarter. These two courses will complete a student's general education requirement in the biological sciences. The second year of the sequence continues with BIOS 20173 Perspectives of Human Physiology in the Autumn Quarter and concludes with BIOS 20175 Biochemistry and Metabolism in the Winter Quarter. BIOS 20172 must be taken concurrently with BIOS 20171 in the Spring Quarter of the first year. The Fundamentals sequence for Biological Sciences majors is also open to non-majors completing their pre-med biology requirements and provides comparable topical coverage. This sequence is open only to first- and second-year non-Biological Sciences majors (or others by consent) and cannot be applied toward a major in Biological Sciences.

BIOS 20170. Microbial and Human Cell Biology. 100 Units.
This course is the entry point into an integrated biology sequence designed to prepare non-biology majors for application to medical school. We explore topics in human cell biology within the context of evolutionary biology, chemistry, microbiology, and medicine. We pay special attention to the influence of prokaryotes on the history of life and to the ecological interactions between humans and their microbiota, which have major implications for human health and disease. Students read and discuss papers from the scientific literature, attend discussions and gain experience with microbiological basic microscopy techniques in lab.
Instructor(s): C. Andrews, R. Zaragoza, E. Kovar Terms Offered: Winter. L.
Prerequisite(s): First or second-year standing, or consent of instructors.

BIOS 20171. Human Genetics and Developmental Biology. 100 Units.
This course covers the fundamentals of genetics, with an emphasis on human traits and diseases. Topics include Mendelian genetics, simple and complex traits, genetic diseases, the human genome, and testing for human traits and diseases. After establishing a foundation in genetics, we will discuss mechanisms underlying differentiation and development in humans. We will focus on events that lead to gastrulation and the establishment of the body plan (how humans develop from an un-patterned egg into a recognizable human form). Other topics may include limb development and stem cell biology.
Instructor(s): O. Pineda-Catalan, R. Zaragoza Terms Offered: Spring. L.
Prerequisite(s): BIOS 20170

BIOS 20172. Introduction to Quantitative Modeling in Biology (Basic) 100 Units.
The goal for this course is to give future biologists the quantitative tools to fully participate in modern biological research. These include descriptive statistics, linear regression, stochastic independence and hypothesis testing, Markov models and stationary probability distributions, solutions of linear differential equations, equilibria and stability analysis of nonlinear differential equations. The ideas are applied to different areas of biology, e.g. molecular evolution, allometry, epidemiology, and biochemistry, and implemented by students in computer assignments using the R computational platform.
Instructor(s): D. Kondrashov Terms Offered: Spring. L.
Prerequisite(s): Two quarters of calculus of any sequence (MATH 13200 or 15200 or 16200). First-year Biology Major standing only.

BIOS 20173. Introduction to Quantitative Modeling in Biology (Advanced) 100Units.
This is a more advanced version of 20151, intended for students with greater mathematical maturity. In addition to the topics covered in the regular version, students will learn about nonlinear least-squares fitting, eigenvalues and eigenvectors, bifurcations and bistability in differential equations. Additional applications will include phylogenetic distance and systems biology.
Instructor(s): D. Kondrashov Terms Offered: Winter. L.
Prerequisite(s): MATH placement of 15200 or higher OR either MATH 15200 or MATH 16200 and second-year standing or higher.

BIOS 20175. Mathematical Modeling for Pre-Med Students I. 100 Units.
This course surveys the basic principles of ecology and evolutionary biology to lay the foundation for further study in all fields of biology. Broad ecological concepts, such as population growth, disease dynamics, and species interactions, will be explored through a combination of published data, simulations, and mathematical models. The emphasis is on "ecological thinking" rather than specific notions. Essential topics in the modern study of evolutionary biology will be covered with a focus on both theory and empirical examples. Examples of topics include history of evolutionary thought, evidence for evolution, mechanisms of microevolution, phylogenetics, molecular evolution, and speciation.
Instructor(s): T. Price, M. Kronforst, C. Andrews, A. Hunter. Terms Offered: Winter. L.
Specific General Education Requirement for Certain Majors

Students should note that several majors have specified requirements for how the biological sciences portion of the general education requirements must be satisfied.

These include Biological Chemistry, Neuroscience, Environmental Science, Geophysical Sciences, and Molecular Engineering.
