Neuroscience

Department Website: http://neuroscience.uchicago.edu/undergraduate

PROGRAM OF STUDY

Neuroscience is concerned with the function of nervous systems. The sheer scope of neuroscience necessitates numerous scientific approaches to achieve understanding of sensation, perception, cognition, and behavior. Consequently, students in the major are provided with access to a wealth of scientific variety, including biology, psychology, physics, chemistry, computer science, engineering, mathematics, statistics, and medicine. Neuroscience faculty at the University of Chicago have expertise in all of these areas and are distributed across the Biological Sciences, Social Sciences, and Physical Sciences Divisions.

The bachelor of arts (BA), bachelor of science (BS), and BS with honors degrees in neuroscience provide a broad foundation in understanding neural function from the perspective of molecules, cells, circuits, systems, organisms, and species. The BA degree provides thorough study in the field of neuroscience while allowing flexibility in elective choice. The BS and BS honors degrees offer a more intensive program of study that includes individual research. Students who wish to incorporate neuroscientific literacy into their degree but have primary interest in other fields can choose to obtain a minor in neuroscience.

SUMMARY OF REQUIREMENTS FOR THE MAJOR IN NEUROSCIENCE

The major curriculum includes nine required neuroscience courses, which provide a comprehensive overview of the field. Students must also take neuroscience electives, which may include up to two neuroscience-related electives. Neuroscience electives increase a student’s knowledge of neural systems, while neuroscience-related electives are included to provide students with tools or context to enhance understanding of neural systems. Elective courses can be selected either to achieve breadth, i.e., broad exposure to many topics, or for depth in a particular area of neuroscience. Students who wish to major in neuroscience are strongly encouraged to declare the major in their second year.

Program Requirements: BA – Nine required neuroscience courses beyond the general education requirement (which should begin in the first year), plus a minimum of seven electives are required for a BA.

Program Requirements: BS – Nine required neuroscience courses beyond the general education requirement (which should begin in the first year), plus a minimum of 10 electives. Enrollment in faculty-supervised research for elective credit culminating in a poster presentation and thesis submission are also required for a BS.

Program Requirements for BS with Honors – The honors program expands on the program requirements for the BS by requiring a minimum GPA, a summer of full-time research, and three quarters of faculty-supervised research for elective credit in the student’s fourth year. In the Spring Quarter of their fourth year, BS with Honors students will submit a thesis and present their research in a public forum. Interested majors must apply for admittance into the honors program in their third year.

GRADING

All courses used to satisfy prerequisites and requirements must be taken for quality grades. Students must pass each course in the Fundamental Neuroscience Sequence (NSCI 20100–20140) with a C or higher. Students are also required to pass general education courses with an average GPA of 2.0 or higher to continue in the program.

GENERAL EDUCATION REQUIREMENTS FOR THE MAJOR

To satisfy the general education requirements, students must take 200 units of Biological Sciences, 200 units of Mathematics, and 200 units of Chemistry from the selected list of general education courses for the neuroscience major (see General Education Table).

BACHELOR OF ARTS DEGREE IN NEUROSCIENCE

The basic degree in neuroscience is the BA. To qualify for a BA, students must minimally satisfy the general education requirements and complete the neuroscience required courses (900 units), 500 units of neuroscience elective courses, and 200 units of neuroscience or neuroscience-related elective courses as listed in the table below.

Neuroscience

STAT 22000  Statistical Methods and Applications  100
CHEM 11300  Comprehensive General Chemistry III  100
or CHEM 12300  Honors General Chemistry III
At least five Neuroscience electives  500
No more than two Neuroscience-related electives  200
Total Units  1600

* Credit may be granted by examination.
^ May also include additional neuroscience electives
** While students may register for multiple quarters of NSCI 29700 Reading and Research in Neuroscience, only one may be counted toward major requirements.

INDEPENDENT RESEARCH

By their third year, students majoring in neuroscience are strongly encouraged to participate in research with a faculty member. This can take many forms, including internships, fellowships, and research for elective credit. See also BS and Honors in Neuroscience. For more information on research opportunities, visit the undergraduate major website. (https://neuroscience.uchicago.edu/research-opportunities/)

BACHELOR OF SCIENCE DEGREE IN NEUROSCIENCE

Students graduate with a bachelor of science in neuroscience (https://neuroscience.uchicago.edu/bachelor-science/) by completing the neuroscience required courses (900 units), 200 units of neuroscience or related elective courses, and 800 units of neuroscience elective courses, which must include one to three quarters of faculty-supervised NSCI 29100 Neuroscience Thesis Research culminating in a written thesis and poster presentation. When enrolled in the neuroscience thesis elective, BS students will be required to attend a minimum of one BS student mentoring meeting each quarter. The thesis and poster will be evaluated by faculty in addition to the faculty thesis supervisor. Neuroscience Thesis Research (NSCI 29100) must be completed before the final quarter of the student’s graduating year to allow sufficient time to prepare the written document and presentation. The additional neuroscience electives and thesis work require approval by the office of the director of undergraduate studies and the thesis advisor. Note that if a student wishes to carry out thesis work with a non-Neuroscience Institute-listed faculty member, the student must contact the director of undergraduate studies for approval in the quarter prior to submitting the thesis proposal.

MAJOR: BACHELOR OF SCIENCE REQUIRED COURSES

NSCI 20101  Foundations of Neuroscience  100
NSCI 20111  Cellular Neurophysiology  100
NSCI 20130  Systems Neuroscience  100
NSCI 20140  Sensation and Perception  100
PHYS 12100-12200  General Physics I-II (or higher)  200
NSCI 20100  Neuroscience Laboratory  100
STAT 22000  Statistical Methods and Applications  100
CHEM 11300  Comprehensive General Chemistry III  100
or CHEM 12300  Honors General Chemistry III
At least eight Neuroscience electives  800
No more than two Neuroscience-related electives  200
Total Units  1900

* Credit may be granted by examination.
** Must include one to three courses of NSCI 29100, NSCI 29101, NSCI 29102 Neuroscience Thesis Research or NSCI 29200, NSCI 29201, NSCI 29202 Neuroscience Honors Thesis Research
^ May also include additional neuroscience electives

HONORS IN NEUROSCIENCE

The BS with honors is an extension of the BS and is targeted toward students with a particularly strong interest in research. To apply for the neuroscience honors program, students must have a minimum GPA of 3.5 in the major and a cumulative GPA of 3.25. This level of achievement must then be maintained throughout the academic year corresponding to the thesis submission. Applications for the honors program will be reviewed by a faculty examining committee. A Neuroscience Institute–listed faculty sponsor and approved topic must be identified before applying.

The honors program begins with 10 weeks of full-time research during the Summer Quarter between the student’s third and fourth years. A stipend is provided during the summer research component of the honors program. Honors students will continue their research as a graded elective research course (NSCI 29200, NSCI
29201, and NSCI 29202 Neuroscience Honors Thesis Research) during Autumn, Winter, and Spring Quarters of the fourth year, which culminates in a public talk and a written thesis. The thesis and public talk will be evaluated by a faculty thesis committee. As part of the research course work, honors students participate in weekly classes in which they share their research with each other and supervising faculty, and receive guidance on formulating testable hypotheses, experimental design, report writing, and oral presentations. They also receive training in the responsible conduct of research. Experimental research may not be credited toward honors in more than one major.

MINOR IN NEUROSCIENCE

The minor in neuroscience is intended to provide neuroscientific literacy for students whose primary interest lies in other fields. Students graduate with a minor in neuroscience by completing NSCI 20101 Foundations of Neuroscience, NSCI 20111 Cellular Neurophysiology, and NSCI 20130 Systems Neuroscience, as well as four neuroscience electives. The minor also requires that students meet the general education requirements in the biological or physical sciences plus MATH 13100-13200 Elementary Functions and Calculus I-II (or higher). Students are strongly encouraged to take STAT 22000 Statistical Methods and Applications (or higher) and NSCI 20140 Sensation and Perception for two of the four electives, if these courses have not already been taken to fulfill major requirements. No course in the neuroscience minor can count toward the student’s major(s) or other minors, nor can it count toward general education requirements. In order to declare a minor in neuroscience or computational neuroscience, students must request a Consent to Complete a Minor Program (http://collegecatalog.uchicago.edu/thecollege/minors/Consent_Minor_Program.pdf) form from their College adviser and submit the completed form to neuromajor@uchicago.edu for review and approval.

MINOR IN COMPUTATIONAL NEUROSCIENCE

This minor is intended to provide literacy in computational neuroscience and is for students who are interested in mathematical approaches applied to neural systems. The minor requires that students meet the general education requirements in the biological or physical sciences plus MATH 13100-13200 Elementary Functions and Calculus I-II (or higher). No course in the computational neuroscience minor can count toward the student’s major(s) or other minors, nor can it count toward general education requirements. In order to declare a minor in neuroscience or computational neuroscience, students must request a Consent to Complete a Minor Program (http://collegecatalog.uchicago.edu/thecollege/minors/Consent_Minor_Program.pdf) form from their College adviser and submit the completed form to neuromajor@uchicago.edu for review and approval.

* Neuroscience majors must meet with the NSCI advisors to discuss an appropriate course equivalent.

DOUBLE MAJORS

Students interested in double majoring in neuroscience and biological sciences, psychology, or cognitive science are limited to double counting seven courses between the majors. Please email neuromajor@uchicago.edu with additional questions about double counting courses.

SAMPLE PROGRAM

Neuroscience is a unique and broad field that allows students to plan their undergraduate career in a variety of ways. Below is a sample plan for when to take NSCI required courses:

Year 1: Biological Sciences, Chemistry, and Mathematics General Education Courses
Year 2: NSCI 20101, NSCI 20111, NSCI 20130, PHYS 12100-12200 General Physics I-II
Year 3: NSCI 20100 and/or NSCI 20140, Electives, Research Opportunities, STAT 22000
Year 4: NSCI 20100 and/or NSCI 20140, Electives, Research Opportunities, STAT 22000

Total Units 600
The neuroscience major general education requirement in the biological sciences can be fulfilled by courses in the Biological Sciences Fundamentals Sequences (BIOS 20186 to 20190) without the Biological Sciences prerequisites (BIOS 20153-20151/20152) unless a student pursues a double major in Biological Sciences. However, all students in the sequence will be expected to possess the mathematical modeling competencies and basic coding in R covered in BIOS 20151/BIOS 20152 and BIOS 20153.

* Credit may be granted by examination.

# BIOS 20171 must be taken concurrently with BIOS 20172.

** Students with a score of 4 or 5 on the Advanced Placement Biology exam may use their AP credit to meet the general education requirement in the biological sciences if the first three quarters of the Advanced Biology sequence are completed.

† To avoid double counting, students who minor in BIOS, CHEM, or MATH must work with the minor-granting program to identify appropriate course substitutions for those courses counting toward the NSCI Major’s general education requirements.

**NEUROSCIENCE COURSES**

**NSCI 20100. Neuroscience Laboratory. 100 Units.**

This course has three components in series, representing (1) molecular neuroscience, (2) cellular electrophysiology, and (3) computation and psychophysics. The course meets one afternoon each week for four hours of laboratory time, including a didactic introduction. Students will be graded on their laboratory reports.

Instructor(s): J. Maunsell; E. Heckscher; M. McNulty Terms Offered: Winter
Prerequisite(s): Neuroscience Fundamentals sequence (NSCI 20101-NSCI 20130), Must be a Neuroscience Major

**NSCI 20101. Foundations of Neuroscience. 100 Units.**

This course is an introduction to the broad field of neuroscience. This is a lecture-based course that aims to introduce undergraduate students to concepts and principles that explain how the nervous system is built and how it functions. Examples of thematic areas covered in lectures include: (a) cellular anatomy of the nervous system, (b) development and evolution of the nervous system, (c) sensory systems, (d) motor systems, (e) cognition and behavior.

Instructor(s): D. Freedman, P. Kratsios, M. Sheffield Terms Offered: Autumn
Equivalent Course(s): BIOS 24101, PSYC 24450

**NSCI 20111. Cellular Neurophysiology. 100 Units.**

This course describes the cellular and subcellular properties of neurons, including passive and active electrophysiological properties, and their synaptic interactions. Readings are assigned from a general neuroscience textbook.

Instructor(s): M. Sheffield, W. Wei Terms Offered: Winter
Prerequisite(s): NSCI 20101, and MATH 13100, or MATH 15100, or MATH 16100. Or consent of instructor
Equivalent Course(s): PSYC 24470, BIOS 24111

**NSCI 20130. Systems Neuroscience. 100 Units.**

This course covers vertebrate and invertebrate systems neuroscience with a focus on the anatomy, physiology, and development of sensory and motor control systems. The neural bases of form and motion perception, locomotion, memory, and other forms of neural plasticity are examined in detail. We also discuss clinical aspects of neurological disorders.

Instructor(s): J. MacLean Terms Offered: Spring
Prerequisite(s): NSCI 20101, NSCI 20111 or consent of instructors
Equivalent Course(s): BIOS 24130, PSYC 24010

**NSCI 20140. Sensation and Perception. 100 Units.**

What we see and hear depends on energy that enters the eyes and ears, but what we actually experience—perception-follows from human neural responses. This course focuses on visual and auditory phenomena, including basic percepts (for example, acuity, brightness, color, loudness, pitch) and also more complex percepts such as movement and object recognition. Biological underpinnings of perception are an integral part of the course.

Instructor(s): R. Lange, Winter; K. Ledoux, Spring. Terms Offered: Spring Winter
Equivalent Course(s): PSYC 20700

**NSCI 20500. Neuroanatomy. 100 Units.**

This course is part of the Study Abroad Neuroscience program in Paris, France. In this course, we will use an understanding of development in order to understand the neuroanatomy of the adult vertebrate nervous system. This understanding will be solidified by dissections of mammalian, fish and bird brains as well as a trip to see myriad brains at the Muséum national d’histoire naturelle. In the second half of the course, neuroanatomical adaptations specific to particular animals will be examined in the context of critical environmental and ecological factors. Examples include postural control in sloths, vision in marine animals and raptors, and the control of muscles of facial expression across mammalian species.

Instructor(s): P. Mason Terms Offered: TBD. Paris Study Abroad Neuroscience Program
Prerequisite(s): Enrollment into the Paris Study Abroad Program
NSCI 20510. Evolution and the Nervous System. 100 Units.
Evolutionary neuroscience has traditionally focused on the neural bases of animal behavior (neuroethology) and employed the methods of comparative anatomy, cellular neurophysiology and behavioral neuropsychology. This course will approach neuroethology from a modern evolutionary perspective, one that integrates findings from genomics, molecular developmental biology and paleontology with insights from neuroethology. Our exploration will include the controversies over the evolutionary origin of neurons and centralized brains, the independent solutions across taxa to processing ecologically important sensory information, and recent insights into the evolution of the neocortex.
Instructor(s): C. Ragsdale Terms Offered: Winter
Prerequisite(s): NSCI 20101 and NSCI 20130, or consent of instructor

NSCI 21000. Social Neuroscience. 100 Units.
Human beings are intensely social creatures. Our health and well-being depend on others. Social neuroscience provides an overarching paradigm to investigate social cognition and behavior, and to determine where we as a species fit within a broader biological context. The course examines how the brain mediates social cognition and behavior. It spans diverse species and disciplines (evolution, neuroscience, psychology, behavioral economics, political science). A wide range of topics is included, including behavioral synchrony, friendship, cooperation, social decision-making, social status and hierarchies, empathy, group affiliation and identity, social influence, etc. Interdisciplinary analyses, by integrating approaches from social sciences and biological sciences, significantly expand our knowledge, and have the potential to improve our social and living conditions.
Instructor(s): J. Decety Terms Offered: Autumn
Equivalent Course(s): CHDV 22350, PSYC 22350, HLTH 22350, BIOS 24137, ECON 21830

NSCI 21015. Biological Psychology. 100 Units.
What are the relations between mind and brain? How do brains regulate mental, behavioral, and hormonal processes; and how do these influence brain organization and activity? This course introduces the anatomy, physiology, and chemistry of the brain; their changes in response to the experiential and sociocultural environment; and their relation to perception, attention, behavioral action, motivation, and emotion.
Instructor(s): S. London Terms Offered: Winter
Prerequisite(s): Some background in biology and psychology.
Equivalent Course(s): PSYC 20300, CHDV 20300

NSCI 21100. Photons to Consciousness: Cellular and Integrative Brain Functions. 100 Units.
This course uses the visual system as a model to explore how the brain works. We begin by considering the physical properties of light. We then proceed to consider the mechanism of sensory transduction, cellular mechanisms of neuron to neuron communication, the operation of small neural networks, strategies of signal detection in neuron networks, and the hierarchical organization of cortical function. We conclude with visually guided behavior and consciousness.
Instructor(s): E. Schwartz Terms Offered: Spring Winter
Prerequisite(s): NSCI 20101 or NSCI 20121
Equivalent Course(s): BIOS 24136

NSCI 21400. Biological Clocks and Behavior. 100 Units.
This course will address physiological and molecular biological aspects of circadian and seasonal rhythms in biology and behavior. The course will primarily emphasize biological and molecular mechanisms of CNS function, and will be taught at a molecular level of analysis from the beginning of the quarter. Those students without a strong biology background are unlikely to resonate with the course material.
Instructor(s): B. Prendergast Terms Offered: Winter
Prerequisite(s): A quality grade in PSYC 20300 Introduction to Biological Psychology. Additional biology courses are desirable. Completion of Core biology will not suffice as a prerequisite.
Equivalent Course(s): BIOS 24248, HLTH 21750, PSYC 21750

NSCI 21500. Fundamentals of Synapses. 100 Units.
In this course, students will learn about the fundamentals of synapses, from molecular analysis to structure and function. Marine and aquatic models have historically provided a unique opportunity to investigate synaptic function due to the large size of their neurons, including the synaptic connections. Today, these synapse models are used to study basic principles of neuron-to-neuron communication (synaptic transmission), as well as disease mechanisms. In addition to lectures and discussions of key literature, this course will feature hands-on laboratory-based exercises in molecular genetics, imaging and physiology of synapses, as well as independent “discovery” projects to explore new topics in synapse biology.
Instructor(s): J. Morgan, J. Rosenthal Terms Offered: Spring
Prerequisite(s): Acceptance into a Spring Quarter program at MBL
Equivalent Course(s): BIOS 27753

NSCI 21515. Introduction to Imaging for Biological Research. 100 Units. 
Many breakthroughs in science have been made possible by revolutionary advances in our ability to visualize biological processes, and recent progress in microscopy has led to important breakthroughs in understanding life at the molecular, cellular, and organismal level. In this course, we will introduce the students to basic techniques in microscopy, starting with an opportunity for students to build their own simple microscopes, and then proceeding all the way to using state-of-the-art confocal, light sheet, and electron microscopes. Students will
explore the challenges of sample preparation, of imaging processes in living cells, and in the computational analysis of imaging data. Throughout the course, students will be able to design their own experiments, and undertake a student-designed research project.

Instructor(s): Wolf, C., Kerr, L. Terms Offered: Spring
Prerequisite(s): Second-year standing or greater (or by consent).
Note(s): Course meets for three weeks, (5-6 days/week, 8 hours per day), at Marine Biological Laboratories, in Woods Hole Massachusetts as part of Spring quarter at MBL. For more information see https://college.uchicago.edu/academics/mbl-spring-quarter-biology
Equivalent Course(s): BIOS 27724

**NSCI 21520. A Deep Dive into the Cell and Molecular Biology of the Brain. 100 Units.**

This course will be an interactive analysis of the cell biology of neurons and glia. Central questions include how do the unique morphologies of neurons and glia shape their cell biology and how do we use different techniques to examine these cells. Other topics include: structure and function of neuronal proteins, membrane excitability, the functions of different glia types, and signaling pathways in synapse formation and development. The course will span three weeks at the Marine Biological Laboratory. Mornings will consist of lectures and critical reading/discussion of the primary literature. In the afternoon, students will perform hands-on experiments on different lab projects that put into practice the concepts and techniques discussed in class.

Instructor(s): W. Green, R. Carrillo Terms Offered: Spring
Prerequisite(s): Acceptance into the MBL Neuroscience Spring Quarter Program

**NSCI 21530. Dynamic Camouflage: Behavior, Visual Perception and Neural Skin Patterning in Cephalopods. 100 Units.**

This course takes an integrative approach to understanding a neurally controlled system of dynamic defense against visual predators. Camouflage is a widespread form of defense throughout the animal kingdom in every known habitat - land or sea. In the oceans, cephalopods (cuttlefish, octopus, squid) have evolved a sophisticated sensorimotor system called Rapid Adaptive Coloration, which can instantaneously change their total body appearance within a fraction of a second to range from highly camouflaged to startlingly conspicuous for a wide range of behaviors. The forms and functions of this dynamic system will be teased apart in integrative fashion in a top-down approach from ecology to organismal biology to organs, tissues and cells. The course touches on neural anatomy, sensation, visual perception (including psychophysics) and animal behavior. There are also applied biology aspects of this system that will be presented as well.

Instructor(s): R. Hanlon Terms Offered: Spring
Prerequisite(s): Acceptance into the MBL Neuroscience Spring Quarter Program
Equivalent Course(s): BIOS 27752

**NSCI 21600. Attention and Working Memory in the Mind and Brain. 100 Units.**

This course will provide a broad overview of current work in psychology and neuroscience related to attention and working memory. We will discuss evidence for sharp capacity limits in an individual’s ability to actively monitor and maintain information in an ‘online’ mental state. Readings will be primarily based on original source articles from peer-reviewed journals, with a focus on behavioral and neural approaches for measuring and understanding these basic cognitive processes.

Instructor(s): E. Vogel, E. Awh Terms Offered: Winter
Prerequisite(s): PQ: NSCI 20101 (Foundations of Neuroscience) is required for Neuroscience majors only.
Equivalent Course(s): PSYC 33830, PSYC 23820

**NSCI 21610. Neuroanatomy of Cranial Nerves and Nuclei. 100 Units.**

This hands-on laboratory course will cover the cranial nerves and their associated nuclei. The logic of cranial nerves, cranial nuclei, suprabulbar control, and thalamic projections will be described. The logic of predicting symptoms associated with lesions in these pathways will be explained. Students will learn how to understand and predict the clinical consequences of interruptions along cranial nerve pathways. Classes will consist of short lectures interspersed with examination and drawing of slides of stained brain sections using projection microscopes. There will be two field trips to local collections of brains and anatomical specimens.

Instructor(s): P. Mason Terms Offered: Autumn
Prerequisite(s): Enrollment into the Paris Study Abroad Program

**NSCI 21620. Structure, Circuits and Development of the Forebrain. 100 Units.**

The forebrain is the largest division in the brains of mammals and birds. This course will address its structure as a laboratory exercise with slides and computer image supplementation. Our study of forebrain circuitry and development will draw on primary research papers and comprehensive reviews, and the rich research resources of the Parisian neuroscience community. Our survey will include thalamus, hypothalamus, the amygdala, and the basal ganglia, but our focus will be on the largest structure in our brains, the neocortex.

Instructor(s): C. Ragsdale Terms Offered: Autumn
Prerequisite(s): Enrollment into the Paris Study Abroad Program

**NSCI 21811. Building the Brain. 100 Units.**

This course describes fundamental principles of how brains grow up from the perspective of the basic organizational unit of brains, the cell. We will detail development from the very earliest events in zygotes to post-natal refinement of synaptic connections years after birth. We will endeavor to understand how principles of neural development were discovered, abandoned, and re-discovered using the lens of history and biography. We
will accomplish these goals with readings of primary literature, discussions of the tools used to discover these principles, and debates on the temerity of declaring that these principles exist.

Instructor(s): B. Kasthuri
Terms Offered: Autumn
Prerequisite(s): NSCI 20101 or instructor consent

NSCI 21825. Constructing consciousness: How do we go from matter to mind? 100 Units.
How does conscious awareness happen? How does it develop within our lifespans and evolve across them? What other organisms might be conscious, and what might their consciousness be like? How do the qualities of our percepts correlate with their physical causes and our mental states? In this mixed lecture and discussion course we will attempt to answer these questions by studying the neural and psychological processes involved in conscious (and unconscious!) sensory perception, along with several prominent models of the neural basis of consciousness. Requirements will include submitting weekly written responses to readings, actively participating in weekly discussions, and writing a roughly four- to seven-page final paper.

Instructor(s): R. Lange
Terms Offered: Autumn
Prerequisite(s): PQ: One of the following courses: PSYC 20300 Biological Psychology; PSYC 20700 Sensation & Perception; NSCI 20111 Cellular Neurophysiology; or NSCI 20130 Systems Neuroscience, or by instructor consent.
Equivalent Course(s): PSYC 28990

NSCI 21900. Neuropharmacology. 100 Units.
This is a one quarter course that will explore neuronal pharmacology. Both the autonomic and central nervous system will be examined. The course has a clinical orientation. The course starts with an overview of the nervous system. In this section, we will explore the cellular aspects of neurons and their basic membrane and electrophysiological properties as well as cellular and molecular aspects of synaptic transmission. The majority of the course will explore different neurotransmitter systems and drugs that interact with these systems.

Instructor(s): A. Fox
Terms Offered: Spring
Prerequisite(s): NSCI 20101, NSCI 20111
Equivalent Course(s): BIOS 24140

NSCI 22010. Neuroscience of Consciousness. 100 Units.
Consciousness has been considered one of great mysteries in human existence. In this course, we will begin by trying to define the term and consider the so-called "hard" and "easy" problems of consciousness. A brief history of ancient civilizations’ views on mental experience will be discussed. We will then go over basic neuroscientific concepts and methods that are being used to study the neural correlates of consciousness. We will explore different states of consciousness and disruptions of consciousness in human patients. We will touch on the related problems of intentionality and free will. Finally, we will discuss prevailing scientific theories of consciousness.

Instructor(s): Hatsopoulos, Nicholas
Terms Offered: Autumn
Prerequisite(s): NSCI 20101

NSCI 22015. Cognitive Psychology. 100 Units.
Viewing the brain globally as an information processing or computational system has revolutionized the study and understanding of intelligence. This course introduces the theory, methods, and empirical results that underlie this approach to psychology. Topics include categorization, attention, memory, knowledge, language, and thought.

Instructor(s): S. Heald, Autumn; M. Rosenberg, Spring
Terms Offered: Autumn Spring
Equivalent Course(s): PSYC 20400

NSCI 22110. Molecular and Translational Neuroscience. 100 Units.
This lecture/seminar course explores the application of modern cellular and molecular techniques to clarify basic mechanisms that underlie neural development, synaptic transmission, protein trafficking, and circuit function and the dysfunction of these fundamental processes that results in neurodevelopmental disorders and age-associated neurological diseases.

Instructor(s): S. Sisodia
Terms Offered: Winter
Prerequisite(s): Neuroscience Fundamental Series (NSCI 20101-20130)
Equivalent Course(s): BIOS 24143

NSCI 22130. Psychoactive Drugs, the Brain and Behavior. 100 Units.
The goal of this course is for the students to understand how psychoactive drugs affect the brain and behavior. Understanding how these drugs work will provide students a window in the relationship between the brain and behavior. Understanding how drugs affect the brain and behavior will also enhance the students understanding of the relationship between psychoactive drugs/medications and society.

Instructor(s): H. de Wit, R. Lee, M. Xu, X. Zhuang
Terms Offered: Winter
Prerequisite(s): For UG: NSCI 20101, NSCI 20111 and NSCI 20130
Equivalent Course(s): NURB 32130

NSCI 22300. Molecular Principles of Nervous System Development. 100 Units.
This elective course provides an overview of the fundamental questions in developmental neurobiology. It is based on primary research papers and highlights key discoveries in vertebrate and invertebrate animals that advanced our understanding of nervous system development. Topics covered, among others, will include
neural stem cells, neuronal specification and terminal differentiation, and circuit assembly. Dogmas and current debates in developmental neurobiology will be discussed, aiming to promote critical thinking about the field. This advanced-level course is open to upper level undergraduate and graduate students and combines lectures, student presentations, and discussion sections. Neuroscience major undergrads need to have completed the Fundamentals of Neuroscience sequence.

Instructor(s): E. Grove, P. Kratsios Terms Offered: Spring
Prerequisite(s): For undergrads: NSCI 20110, 20120, 20130 and a basic understanding of Genetics, or "BIOS 20187" (Fundamentals of Genetics) is recommended, but not required.
Equivalent Course(s): NURB 32300, DVBI 32300, CPNS 32300

**NSCI 22400. Neuroscience of Seeing. 100 Units.**
This course focuses on the neural basis of vision, in the context of the following two questions: 1. How does the brain transform visual stimuli into neuronal responses? 2. How does the brain use visual information to guide behavior? The course covers signal transformation throughout the visual pathway, from retina to thalamus to cortex, and includes biophysical, anatomical, and computational studies of the visual system, psychophysics, and quantitative models of visual processing. This course is designed as an advanced neuroscience course for undergraduate and graduate students. The students are expected to have a general background in neurophysiology and neuroanatomy.

Instructor(s): W. Wei, J. Maunsell, M. Sherman, S. Shevell Terms Offered: Autumn
Prerequisite(s): NSCI 20101 and NSCI 20111, or consent of instructor
Equivalent Course(s): CPNS 34133, NURB 34133, BIOS 24133, PSYC 24133, PSYC 34133

**NSCI 22420. The Neuroscience of Memory and its Disorders. 100 Units.**
This course examines contemporary theories of brain mechanisms that support our ability to remember and how disruption of these mechanisms produces clinical memory disorders. We will discuss three major concepts through which modern research on memory is organized: the concept of distinct brain systems that support memory (memory systems), the concept of brain reorganization as the biological basis of memories (neuroplasticity and the engram), and the concept that memories actively change over time (consolidation and forgetting). For each of these concepts, we will discuss the historical development, evaluate relevant neuroscience research, and explore implications for understanding memory impairments caused by neurological disorders such as Alzheimer’s disease, brain trauma, epilepsy, and others.

Instructor(s): J. Voss Terms Offered: Spring
Prerequisite(s): NSCI 20101, NSCI 20111 and NSCI 20130. Or consent of instructor.

**NSCI 22450. Conquest of Pain. 100 Units.**
This course examines the biology of pain and the mechanisms by which anesthetics alter the perception of pain. The approach is to examine the anatomy of pain pathways both centrally and peripherally, and to define electrophysiological, biophysical, and biochemical explanations underlying the action of general and local anesthetics. We discuss the role of opiates and enkephalins. Central theories of anesthesia, including the relevance of sleep proteins, are also examined.

Instructor(s): K. Ruskin Terms Offered: Winter
Prerequisite(s): Three quarters of a Biological Sciences Fundamentals Sequence, CHEM 2200-22100-22200 or BIOS 20200 and prior course in neurobiology or physiology is recommended.
Equivalent Course(s): BIOS 24217

**NSCI 22460. Anatomy of Selected Brain Circuits. 100 Units.**
The course will provide an introduction to the anatomy and function of specific brain circuits. Students will participate in the dissection of human and sheep brains to uncover and describe gross-anatomical connectivity patterns of brain areas involved in cognition, learning, emotion, and movement control. We will use histological and microscopic techniques to visualize and describe circuits and specific types of neurons within these circuits. The course will further introduce students to the latest EM/histological reconstruction techniques.

Instructor(s): C. Hansel, B. Kasthuri Terms Offered: Spring
Prerequisite(s): NSCI 20101, NSCI 20130 or consent of instructor

**NSCI 22520. Mind, Brain and Meaning. 100 Units.**
What is the relationship between physical processes in the brain and body and the processes of thought and consciousness that constitute our mental life? Philosophers and others have puzzled over this question for millennia. Many have concluded it to be intractable. In recent decades, the field of cognitive science--encompassing philosophy, psychology, neuroscience, computer science, linguistics, and other disciplines--has proposed a new form of answer. The driving idea is that the interaction of the mental and the physical may be understood via a third level of analysis: that of the computational. This course offers a critical introduction to the elements of this approach, and surveys some of the alternative models and theories that fall within it. Readings are drawn from a range of historical and contemporary sources in philosophy, psychology, linguistics, and computer science. (B) (II)

Instructor(s): J. Bridges; L. Kay; C. Kennedy Terms Offered: Autumn
Equivalent Course(s): COGS 20001, PHIL 26520, PSYC 26520, PHIL 36520, LING 26520, PSYC 36520, LING 36520

**NSCI 22535. The Psychology and Neurobiology of Stress. 100 Units.**
This course explores the topic of stress and its influence on behavior and neurobiology. Specifically, the course will discuss how factors such as age, gender, and social context interact to influence how we respond to stressors.
both physiologically and behaviorally. The course will also explore how stress influences mental and physical health.

Instructor(s): G. Norman Terms Offered: Spring
Equivalent Course(s): PSYC 25750, CHDV 25750

**NSCI 22870. Neural Interfaces for Restoration and Augmentation. 100 Units.**
The objective of this course is to survey the science and engineering that underlie Brain-Machine Interfaces (BMIs). This course will discuss a variety of neural interfaces to restore sensory or motor function. I will describe the neural systems and the hardware and algorithms involved, and explore the general principles that guide attempts to read signals directly from the nervous system to drive extra-corporeal devices, bypassing the muscles, and write signals back in to restore sensation, bypassing native sensory transduction. I will leverage BMI experiments taking place in Chicagoland (including UChicago) for live demonstrations of BMIs in action.

Instructor(s): S. Bensmaia Terms Offered: Autumn
Prerequisite(s): NSCI 20101
Equivalent Course(s): NURB 32870, CPNS 32870

**NSCI 23400. Synaptic Physiology. 100 Units.**
This course covers the basic principles of synaptic transmission and plasticity using a combination of lecture and discussion of primary literature. Lecture topics cover membrane electrical phenomena that lead to release of neurotransmitter presynaptically, as well as the physiological consequences of postsynaptic receptor activation. Paper discussions, which make up ~ 2/3 of the course, are centered on two major topics: 1) The molecular machinery controlling synaptic vesicle exocytosis and recycling, and 2) Synaptic plasticity covering LTP, LTD, Metaplasticity, Spike-timing dependent plasticity and Homeostatic plasticity. There is significant emphasis on the connections between the various forms of synaptic modification and behavior.

Instructor(s): D. McGehee Terms Offered: Autumn
Prerequisite(s): Upper undergrads by consent of instructor
Equivalent Course(s): NURB 32400

**NSCI 23480. Neurogenetics. 100 Units.**
This course introduces human and mouse genetics through the lens of neurological disorders. It starts with genetic concepts and the principles of genetic approaches, followed by human genetic studies of neocortex development and original findings in repeat expansion diseases. We will discuss concurrent concepts in genetic diagnosis and therapeutic strategies. This course is open to graduate and upper-level undergraduate students. It combines lectures and discussion sections.

Instructor(s): X. Zhang Terms Offered: Spring
Prerequisite(s): BIOS 20187, NSCI 20101, or consent of instructor
Equivalent Course(s): HGEN 33480, NURB 33480

**NSCI 23500. Survey of Systems Neuroscience. 100 Units.**
This lab-centered course teaches students the fundamental principles of vertebrate nervous system organization. Students learn the major structures and the basic circuitry of the brain, spinal cord and peripheral nervous system. Somatic, visual, auditory, vestibular and olfactory sensory systems are presented in particular depth. A highlight of this course is that students become practiced at recognizing the nuclear organization and cellular architecture of many regions of brain in rodents, cats and primates.

Instructor(s): Oswald, A. M. Terms Offered: Autumn
Prerequisite(s): NSCI 20100, NSCI 20111, NSCI 20130.
Note(s): Undergrads by consent only
Equivalent Course(s): CPNS 30116, ORGB 32500, NURB 31600

**NSCI 23700. Methods in Computational Neuroscience. 100 Units.**
Topics include (but are not limited to): relating neural data to behavior, Signal Detection theory, models of vision and artificial neural networks, Information Theory, Generalized Linear Models, dimensionality reduction, classification, and clustering.

Instructor(s): M. Kaufman Terms Offered: Spring
Prerequisite(s): For Neuroscience Majors: NSCI 20130, BIOS 26210 and BIOS 26211 which must be taken concurrently, or consent of instructor.
Note(s): CB.
Equivalent Course(s): BIOS 24231, PSYC 24231, CPNS 34231

**NSCI 23810. Neurons and Glia: A Cellular and Molecular Perspective. 100 Units.**
This course will be an interactive, in-depth analysis of the cell biology of neurons and glia. We will learn and discuss the latest techniques used, for example, to study the structure and function of neuronal proteins. In this way we will illuminate the central concepts that define our understanding of the cell and molecular biology of neurons and glia. The course will consist of lectures and critical reading of contemporary literature.

Instructor(s): R. Carrillo; W. Green Terms Offered: Spring
Prerequisite(s): Neuroscience Majors: NSCI 20101-20130 (Fundamental Neuroscience Sequence) Biological Sciences Majors: NSCI 20101-20130, or three quarters of a Biological Sciences Fundamentals Sequence
Equivalent Course(s): BIOS 24251, NURB 34810
NSCI 24000. Modeling and Signal Analysis for Neuroscientists. 100 Units.
The course provides an introduction into signal analysis and modeling for neuroscientists. We cover linear and nonlinear techniques and model both single neurons and neuronal networks. The goal is to provide students with the mathematical background to understand the literature in this field, the principles of analysis and simulation software, and allow them to construct their own tools. Several of the 90-minute lectures include demonstrations and/or exercises in Matlab.
Instructor(s): W. van Drongelen Terms Offered: Spring, L.
Prerequisite(s): Undergraduates: Biology Major - BIOS 26210 and 26211, or consent of instructor. Neuroscience Major - NSCI 20130, BIOS 26210 and 26211, or consent of instructor.
Note(s): CB.
Equivalent Course(s): CPNS 32111, BIOS 24408

NSCI 29100. Neuroscience Thesis Research. 100 Units.
Scholar or Research Thesis.
Instructor(s): Staff Terms Offered: Autumn, Spring, Summer, Winter
Prerequisite(s): By consent of instructor and approval of major director.

NSCI 29101. Neuroscience Thesis Research II. 100 Units.
Second quarter of scholarly or research thesis that follows NSCI 29100
Instructor(s): Staff Terms Offered: Autumn, Spring, Summer, Winter
Prerequisite(s): NSCI 29100, and consent of instructor, and approval of major director.

NSCI 29102. Neuroscience Thesis Research III. 100 Units.
Third quarter of scholarly or research thesis for BS students
Instructor(s): Staff Terms Offered: Autumn, Spring, Summer, Winter
Prerequisite(s): NSCI 29101, and consent of instructor, and approval of major director.

NSCI 29200. Neuroscience Honors Thesis Research. 100 Units.
Scholar or Research Thesis.
Instructor(s): Staff Terms Offered: Autumn
Prerequisite(s): By consent of instructor and approval of major director. Open to Neuroscience majors who are candidates for honors in Neuroscience.

NSCI 29201. Neuroscience Honors Thesis Research II. 100 Units.
Second quarter of BS Honors student thesis research
Instructor(s): Staff Terms Offered: Winter
Prerequisite(s): NSCI 29200, and consent of instructor, and approval of major director. Open to Neuroscience majors who are candidates for honors in Neuroscience.

NSCI 29202. Neuroscience Honors Thesis Research III. 100 Units.
Third quarter of BS Honors student thesis research
Instructor(s): Staff Terms Offered: Spring
Prerequisite(s): NSCI 29201, and consent of instructor, and approval of major director. Open to Neuroscience majors who are candidates for honors in Neuroscience.

NSCI 29700. Reading and Research in Neuroscience. 100 Units.
BA Students can do reading and research in an area of neuroscience under the guidance of a faculty member. A written report is required at the end of the quarter.
Instructor(s): Staff Terms Offered: Autumn, Spring, Summer, Winter
Prerequisite(s): By consent of instructor and approval of NSCI Undergraduate Director.
Note(s): Must be a Bachelor of Arts student. Students are required to submit the College Reading & Research form.
